Trans fat can increase the risk of developing cardiovascular disease.

Trans fat is a nutrient to get less of.

Update on Trans Fat

On June 16, 2015, the U.S. Food and Drug Administration (FDA) took action that will significantly reduce the use of partially hydrogenated oils, the major source of artificial *trans* fats in the food supply. This action is expected to reduce cardiovascular disease and prevent thousands of fatal heart attacks each year in the U.S.

FDA is providing companies three years to either reformulate products without partially hydrogenated oils and/or petition FDA to permit specific uses. Food companies have already been working to remove partially hydrogenated oils from processed foods and FDA anticipates that many may eliminate them ahead of the three-year compliance date.

It's important to note that *trans* fat will not be completely gone from foods because it occurs *naturally* in small amounts in meat and dairy products, and is present at very low levels in other edible oils.

-*Trans* Fat

-What It Is

Trans fat is an unsaturated fat, but it is structurally different than unsaturated fat that occurs naturally in plant foods. *Trans* fat has **detrimental health effects** and is not essential in the diet.

There are **two sources** of *trans* fat:

- **Trans** fat formed naturally this type of *trans* fat is produced in the gut of some grazing animals (such as cattle and sheep).
- Trans fat formed artificially during food processing this type of trans fat is created during a process called "partial hydrogenation" in which hydrogen is added to liquid vegetable oil to make it more solid, and therefore more resistant to becoming spoiled or rancid. The process generally does not make the oil completely solid, resulting in "partially" hydrogenated oils.

⊣ Where It Is Found

Trans fat formed naturally is found in small amounts in some animal products, such as meats and dairy products.

Trans fat formed artificially during food processing is found in partially hydrogenated oils used in a variety of foods, including:

- Coffee creamer
- Fast food
- Frozen pizza
- Grain-based desserts (such as cakes, cookies, and frozen pies)
- Ready-to-use frostings
- Refrigerated dough products (such as biscuits and cinnamon rolls)
- Savory snacks (such as crackers and microwave popcorn)
- Vegetable shortening and stick margarine

⊣What It Does

Partially hydrogenated oils are used by food manufacturers to improve the texture, shelf life, and flavor stability of foods. Partially hydrogenated oils should not be confused with "fully hydrogenated oils," which are solid fats that contain very low levels of *trans* fat.

Health Facts

- About half of the *trans* fat Americans consume is from partially hydrogenated oils.
- Trans fat increases the level of low-density lipoprotein (LDL or "bad") cholesterol and decreases the level of high-density lipoprotein (HDL or "good") cholesterol in the blood which, in turn, can increase the risk of developing cardiovascular disease. Cardiovascular disease is the leading cause of death in both men and women in the U.S.
- The *Dietary Guidelines for Americans* recommends keeping the intake of *trans* fat **as low as possible** by limiting foods containing **partially hydrogenated oils** (a source of artificial *trans* fat). Eating foods with even small amounts of *trans* fat can add up to a significant intake over time.

For Reducing Trans Fat in Your Diet

Use the **Nutrition Facts Label** as your tool for reducing consumption of *trans* fat formed during food processing. The Nutrition Facts Label on food and beverage packages shows the amount in grams (g) of *trans* fat in one serving of the food.

Trans fat has no Percent Daily Value (%DV), so use the amount of grams (g) as a guide.

Look for partially hydrogenated oils on the ingredient list on a food package.

NOTE: The Nutrition Facts Label can state 0 g of *trans* fat if the food product contains less than 0.5 g of *trans* fat per serving. Thus, if a product contains partially hydrogenated oils, the

than 0.5 g of *trans* fat per serving. Thus, if a product contains partially hydrogenated oils, then it might contain small amounts of *trans* fat even if the label says 0 g of *trans* fat.

Switch from stick margarine to soft margarine (liquid, spray, or tub).

Cook and bake with liquid oils (such as canola and olive oil) instead of solid fats (such as butter, lard, and shortening).

Try baking, broiling, grilling, or steaming. These cooking methods do not add extra fat.

Limit grain-based desserts and savory snacks (such as cakes, cookies, crackers, and microwave popcorn).

Choose lean cuts of meats and skinless poultry.

Substitute fat-free (skim) or low-fat (1%) dairy products (such as cheese, milk, and yogurt) or fortified soy beverages for regular/full-fat (whole) dairy products.

When eating out, ask which fats are being used to prepare your meal. You can also request to see nutrition information, which is available in many chain restaurants.
